**Project Information**

**Scope of Audit**

**Check Vulnerabilities**

**Issue Categories**

**Security issues per severity**

**Transaction code**

**Compiler Testing**

**Testing Contract**

**Result**

**Closing Summary**

## Project Information

**Project Name: LandminingNFT**

**Network: Polygon (Polygonscan)**

**Contract Address:**

**0xE34553ec5c226432ea12e6A86734676A48E56c50**

**Type: NFT Staking**

**Max amount: N/A**

**Min amount: 5 MATIC**

**Dev fee: 10%**

**Owner fee: 0%**

**Marketing: 0%**

**Withdraw system:**

**Anytime**

**Minimum Withdrawal: 0 MATIC**

**Referral: 7%, 3%, 1%**

**Withdraw referral: Automatic**

**Max Referral: Unlimited**

**Reward system: Daily from 2% - 2.5%**

## **Scope of Audit**

**The scope of this audit was to analyze and document the landminingNFT smart contract codebase for quality, security, and correctness. Any errors or incorrect will be fixed by our team.**

## **Check Vulnerabilities**

**We scanned and checked those commonly known and specific vulnerabilities based on the solidity code of the project. Here are some of the commonly known vulnerabilities that we considered.**

- **Compiler**
- **Struct**
- **Plan**
- **Functions**
- **Users Checkpoint**
- **Timestamp**
- **Gas Limit and Loops**
- **Byte array**
- **Backdoor**
- **Transfer forward**
- **Redundant fallback**

## Number of issues per severity

| Type        | High | Medium | Low | Informational |
|-------------|------|--------|-----|---------------|
| Open        | 0    | 0      | 0   | 0             |
| Acknowledge | 0    | 0      | 2   | 1             |
| Closed      | 0    | 0      | 2   | 1             |

## Transaction Code

**There are few transactions code base of the smart contract of this project. Each transaction will be written on the blockchain, and no one can be manipulated or change.**

### **1. LandminingNFT (ROI)**

- 1. Launch Function**
- 2. Withdraw Function**
- 3. Mint Function**

## 2. Mint

```
function Mint(address payable referrer,uint8 plan) public payable {  
    _mint(referrer, plan, msg.sender, msg.value);  
}  
  
function _mint(address payable referrer, uint8 plan, address payable sender, uint256 value) private {  
    require(value >= INVEST_MIN_AMOUNT);  
    require(plan < 6, "Invalid plan");  
    require(startUNIX < block.timestamp, "contract hasn't started yet");
```

## 3. Withdraw

```
167  
168 ▾    function withdraw() public {  
169        User storage user = users[msg.sender];  
170  
171        uint256 totalAmount = getUserDividends(msg.sender);  
172
```

**Overall function transaction will be seen at write contract overview. No backdoor or further function can cause of draining the contract.**

- 1. Launch**
- 2. Mint**
- 3. Withdraw**

## Compiler Test

**Compiled and tested under 3<sup>rd</sup> party solidity compiler.**

|                       |         |
|-----------------------|---------|
| 0.5.8+commit.23d335f2 | SUCCESS |
| No Warning Detected   | SUCCESS |
| Compiled Success      | SUCCESS |

## Contract Testing

**Contract deployed and tested with our team before we released the audited report.**

**Network:**

**Polygon Testnet Mumbai**

**Deployed:**

**08.08.22**

**Contract Link:**

**<https://mumbai.polygonscan.com/address/0xdECaf0ECc0a107aF84422Aa8F0807e7F302B2CE6>**

## Result

**No major issue was found. Some false positive errors were reported by the tool. All the other issues have been categorized according to their level of severity, the team improved and fixed it before the publicity of the project.**

## Closing Summary

**Overall, smart contracts are very well written and adhered to guidelines. Minor issues were discovered during the audit that has been fixed.**
